About me

Trayan Iliev

- CEO of IPT – Intellectual Products & Technologies
- Oracle® certified programmer 15+ Y
- end-to-end reactive fullstack apps with Java, ES6/7, TypeScript, Angular, React and Vue.js
- 12+ years IT trainer
- Voxxed Days, jPrime, jProfessionals, BGOUG, BGJUG, DEV.BG speaker
- Organizer RoboLearn hackathons and IoT enthusiast

Course Schedule

- ❖ Block 1: 9:00 – 11:00
- ❖ Pause: 11:00 – 11:15
- ❖ Block 2: 11:15 – 13:15

Where to Find the Code?

Java Web Development projects and examples are available @ GitHub:

<https://github.com/iproduct/java-academy-2022>

Agenda for This Session

- **Java Class structure** – package, imports, fields, methods, access modifiers;
- **Creating objects** – constructors, order of initialization, static members, keyword this, constructors overloading;
- **Working with methods** – designing methods, arguments and return values, overloading, static methods, access modifiers;
- **Define the scope of variables** – class(static), local, instance variables;
- **Apply encapsulation** principles to a class;
- **Understand objects equality** – the difference between “==” and equals();
- **Wrapper Classes**;
- **Distinguish between Object reference and primitive variables**, type casting; Methods reference and primitive arguments;
- **Enumerations**;
- **Object lifecycle** – destroying objects, garbage collection – finalize();

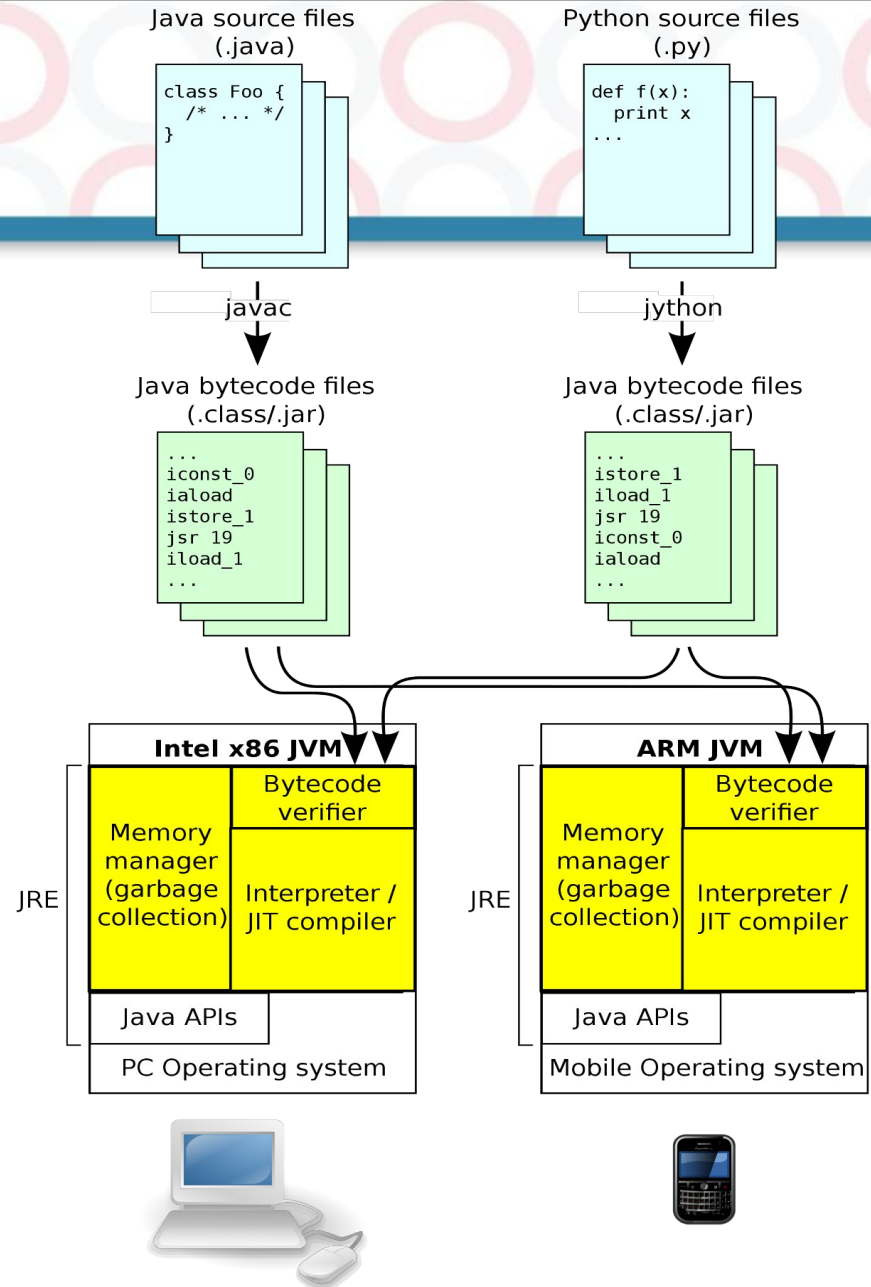

Key Features of Java Language

- **Single base hierarchy** - inheritance from only one parent class, with the possibility of implementation of multiple interfaces
- **Garbage Collector** – portability and platform independence, fewer errors
- **Secure Code** – separation of business logic from the error handling and exceptions
- **Multithreading** - easy realization of parallel processing
- **Persistence** – Java Database Connectivity (JDBC) and Java Persistence API (JPA)

Integrated Development Environments for Java Applications

- Java™ development environment types:
- JavaSE, JavaEE, JavaME, JavaFX
- JavaSE: Java Development Kit (JDK) and Java Runtime Environment (JRE)
- Java™ compiler - javac
- Java Virtual Machine (JVM) - java
- Source code → Byte code
- Installing JDK 8+
- Compile and run programs from the command line
- IDEs: IntelliJ IDEA, Eclipse

Java Virtual Machine (JVM)

Java Application Stack

Java™ Custom Application – Level & patterns of garbage production, Concurrency, IO/Net, Algorithms & Data structures, API & Frameworks

Application Server – Web Container, EJB Container, Distributed Transactions Dependency Injection, Persistence - Connection Pooling, Non-blocking IO

Java™ Virtual Machine (JVM) – Gartbage Collection, Threads & Concurrency, NIO

Operating System – Virtual Memory, Paging, OS Processes and IO/Net libraries

Hardware Platform – CPU, Memory, IO, Network

Processing Node 1

Processing Node2

...

Processing Node N

Level of Optimization
↓

Classes, Objects and References

- **Class** - set of objects that share a common structure, behaviour and possible links to objects of other classes = **objects type**
 - ✓ **structure** = attributes, properties, member variables
 - ✓ **behaviour** = methods, operations, member functions, messages
 - ✓ **relations** between classes: **association, inheritance, aggregation, composition** – modeled as attributes (**references** to objects from the connected class)
- **Objects** are instances of the class, which is their addition:
 - ✓ own state
 - ✓ unique identifier = reference pointing towards object

Object (Reference) Data Types

- Creating a class (a new data type)

```
class MyClass { /* attributes and methods of the class */ }
```

- Create an object (instance) from the class MyClass :

```
MyClass myObject = new MyClass();
```

- Declaration and initialization of attributes:

```
class Person {  
    String name = "Anonymous";  
    int age;  
}
```

- Access to attribute: `Person p1 = new Person();`
`p1.name = "Ivan Petrov";` `p1.age = 28;`

Creating Objects

- Class **String** – modeling string of characters:

- **declaration**:

```
String s;
```

- **initialization** (on separate line):

```
s = new String("Hello Java World");
```

- **declaration + initialization**:

```
String s = new String("Hello Java World");
```

- **declaration + initialization** (shorter form, applies only to the class String):

```
String s = "Hello Java World";
```

SOLID Design Principles of OOP

1. **Single responsibility principle** - a class should only have a single responsibility, that is, only changes to one part of the software's specification should be able to affect the specification of the class.
2. **Open-closed principle** - software entities should be open for extension, but closed for modification.
3. **Liskov substitution principle** - Objects in a program should be replaceable with instances of their subtypes without altering the correctness of that program.
4. **Interface segregation principle** - Many client-specific interfaces are better than one general-purpose interface.
5. **Dependency inversion principle** - depend upon abstractions, not concretions.

Object Diagram

Packages and Access Specifiers

- ❖ Packages and directories
- ❖ Importing packages – import
- ❖ Access specifiers
 - **public**
 - **private**
 - **protected**
 - **Friendly access** – by default within the package

Primitive and Object Data Types

- **Primitive** data types, **object wrapper** types and default values for attributes of primitive type

– boolean	-->	Boolean	false
– char	-->	Character	'\u0000'
– byte	-->	Byte	(byte) 0
– short	-->	Short	(short) 0
– int	-->	Integer	0
– long	-->	Long	0L
– float	-->	Float	0.0F
– double	-->	Double	0.0D
– void	-->	Void	

❖ **BigInteger** and **BigDecimal** - higher-precision numbers

Primitive Type Literals

- in decimal notation:
 int: 145, 2147483647, -2147483648
 long: 145L, -1L, 9223372036854775807L
 float: 145F, -1f, 42E-12F, 42e12f
 double: 145D, -1d, 42E-12D, 42e12d
- in hexadecimal notation: 0x7ff, 0x7FF, 0X7ff, 0X7FF
- in octal notation: 0177
- in binary notation: 0b11100101, 0B11100101

Object (Reference) Data Types

- Initialization with default values
- Value of uninitialized reference = **null**
- Declaring class methods

```
class Person {
```

```
    String name;
```

```
    int age;
```

```
    String changeNameAndAge (String aName, int anAge) {
```

```
        name = aName;
```

```
        age = anAge;
```

```
        return "Name: " + name + "Age: " + age;
```

```
    }
```

```
}
```

Method Name

Arguments

Return Type

Method Body

Returning Value

Object Constructors in Java

- Initialization of objects with constructors
- **Overloading** of constructors and other methods
- Default constructors
- Reference to the current object – **this**

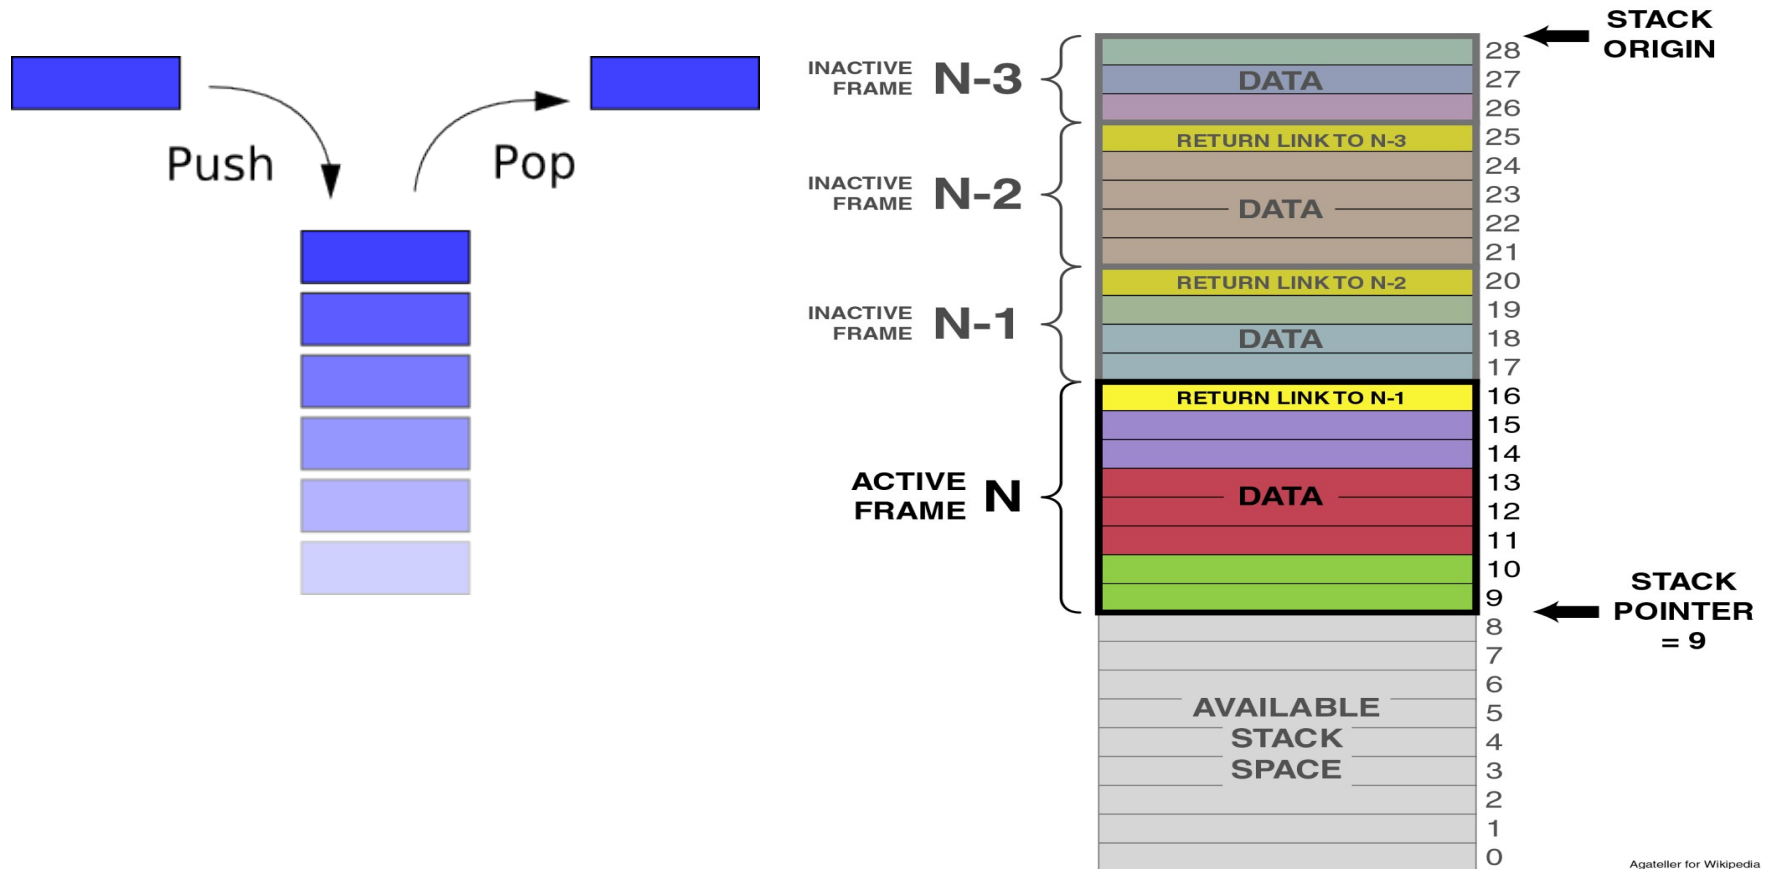

Objects Initialization. Array initialization

- Initialization in declaration
- Initialization in constructor
- „Lazy“ initialization
- Initialization of static class members
- One-dimensional and multi-dimensional arrays
- Array initialization

Memory Types

- **Register memory** - CPU registers, fast, small numbers stored operand instructions just before treatment
- **Program Stack** = Last In, First Out (LIFO) – Keep primitive data types and references to objects during program execution
- **Dynamically allocated memory – Heap** – can store different sized objects for different periods of time, can create new objects dynamically and to be released – Garbage Collector
 - Young generation – objects that exist for short period
 - Old generation – objects that exist longer
 - Permanent Generation = class definitions. **Java 8+ Metaspace**
- **Constant storage, non-RAM storage (external memory)**

Program Stack

```

Stack and Heap (Quick Review)

```
int n = 42;  
boolean flag = true;  
char ch = 'X';  
Integer wrapper = n;  
String message = "Hi from Java!";  
int[] fibonacci = { 0, 1, 1, 2, 3, 5, 8 };
```

Stack and Heap (Quick Review)

```
n = 100;  
flag = !flag;  
h = ++ch;  
wrapper = ++wrapper;  
message = null;  
fibonacci[3] = 42;
```

Variable Scopes

```
public class VarScopes {  
    static int s1 = 25;  
    int i1 = 350;  
    public static void main(String[] args) {  
        if(s1 > 10){  
            int a = 42;  
            // Only a available  
            {  
                int b = 108; // Both a & b are available  
            }  
            // Only a available, b is out of scope  
        }  
        // a & b are out of scope  
    }  
}
```

Operators in Java - I

- Assignment operator
- Mathematical operators
- Relational operators
- Logical operators
- Bitwise operators
- String operators
- Operators for type conversion
- Priorities of operators

Operators in Java - II

- Each operator has priority and associativity - for example, $+$ and $-$ have a lower priority from $*$ and $/$
- The priority can be set clearly using brackets (and) - for example $(y - 1) / (2 + x)$
- According associativity operators are left-associative, right-associative and non-associative: For example:
 $x + y + z \Rightarrow (x + y) + z$, because the operator $+$ is left-associative
- if it was right associative, the result would be
 $x + (y + z)$

Operators in Java - III

- Assignment operator: **=**
 - is not symmetrical – i.e. **x = 42** is OK, **42 = x** is NOT
 - to the left always stands a variable of a certain type, and to the right an expression from the same type or type, which can be automatically converted to present
- Mathematical operators:
 - with one argument (unary): **-, ++, --**
 - with two arguments (binary): **+, -, *, /, %** (remainder)
- Combined: **+=, -=, *=, /=, %=**

For example: **a += 2** \Leftrightarrow **a = a + 2**

Send Arguments by Reference or by Value

- Formal and actual arguments - Example:

Static method - no **this**

Formal Argument
- copies the actual value

```
public static void incrementAgeBy10(Person p){  
    p.age = p.age + 10;  
}
```

```
Person p2 = new Person(23434345435L, "Petar Georgiev",  
"Plovdiv", 39);
```

```
incrementAgeBy10(p2);
```

Actual Argument

```
System.out.println(p2);
```

Send Arguments by Reference and Value

- **Case A:** When the argument is a primitive type, the formal argument copies the actual value
- **Case B:** When the argument is a **object type**, the formal argument **copies reference** to the actual value
- **Cases A & B:** Changes in the copy (formal argument) **does not reflect** the actual argument
- However, if formal and actual argument point to the same object (**Case B**) – then **changes in properties (attribute values) of this object are available from the calling method** – i.e. we can return value from this argument

Operators in Java - IV

- Relational operators (comparison): **==, !=, <=, >=**
- Logical operators: **&& (AND), || (OR)** and **! (NOT)**
the expression is calculated from left to right **only when it's necessary** for determining the final outcome
- Bitwise operators: **& (AND), | (OR)** and **~ (NOT), ^ (XOR),
&=, |=, ^=**
- Bitwise shift: **<<, >>** (preserves character), **>>>** (always inserts zeros left – does not preserve character), **<<=, >>=, >>>=**

Operators in Java - V

- Triple **if-then-else** operator:

<boolean-expr> ? <then-value> : <else-value>

- String concatenation operator: **+**

- Operators for type conversion (type casting):

(byte), (short), (char), (int), (long), (float) ...

- Priorities of operators:

unary > binary arithmetical > relational > logical > three-argumentative operator if-then-else > operators to assign a value

Controlling Program Flow - I

- Conditional operator - **if-else**
- Returning Value – **return**
- Operators organizing cycle - **while, do while, for, break, continue**
- Operator to select one from many options - **switch**

Controlling Program Flow - II

- Conditional operator **if-else**:

```
if(<boolean-expr>)  
    <then-statement>
```

or

```
if(<boolean-expr>)  
    <then-statement>  
else  
    <else-statement>
```

Controlling Program Flow - III

- Returning value to exit the method: **return;** or **return <value>;**
- Operator to organize cycle **while**:
while(<boolean-expr>)
<body-statement>
- Operator to organize cycle **do-while**:
do <body-statement>
while(<boolean-expr>);

Controlling Program Flow - IV

- Operator to organize cycle **for**:

**for(<initialization>; <boolean-expr>; <step>)
<body-statement>**

- Operator to organize cycle **foreach**:

**for(<value-type> x : <collection-of-values>)
<body-statement-using-x>**

Ex.: **for(Point p : pointsArray)**

System.out.println("(" + p.x + ", " + p.y + ");");

Controlling Program Flow - V

- Operators to exit block (cycle) **break** and to exit iteration cycle **continue**:

```
<loop-iteration> {
```

```
//do some work
```

```
continue; // goes directly to next loop iteration
```

```
//do more work
```

```
    break; // leaves the loop
```

```
    //do more work
```

```
}
```

Controlling Program Flow - VI

- Use of labels with **break** and **continue**:

outer_label:

```
<outer-loop> {  
    <inner-loop> {  
        //do some work  
        continue; // continues inner-loop  
        //do more work  
        break outer_label; // breaks outer-loop  
        //do more work  
        continue outer_label; // continues outer-loop  
    }  
}
```

Controlling Program Flow - VII

❖ Selecting one of several options **switch**:

```
switch(<selector-expr>) {  
    case <value1> : <statement1>; break;  
    case <value2> : <statement2>; break;  
    case <value3> : <statement3>; break;  
    case <value4> : <statement4>; break;  
    // more cases here ...  
    default: <default-statement>;  
}
```

Enumeration Types

```
public class MyEnumeration {  
    public enum InvoiceType { SIMPLE, VAT }  
    public static void main(String[] args) {  
        for(InvoiceType it : InvoiceType.values())  
            System.out.println(it);  
    }  
}
```

Результат: *SIMPLE*
VAT

Низове

- Класът **String** предоставя **immutable** обекти – т.е. всяка операция върху низа създава нов обект в хипа
- **StringBuilder** – предоставя ефикасен откъм ресурси начин да модифициране на низове, като реализира **Reusable Design Pattern: Builder** – за постъпково изграждане на низа (основно с метод **append** и **insert**)
- Основни операции в класа **String**. Форматиран изход – метод **format()** и клас **Formatter**. Спецификатори:

%[argument_index\$][flags][width][.precision]conversion

Конверсия на типа при форматиране

- d – decimal, интегрални типове
- c – character (unicode)
- b - boolean
- s - String
- f – float, double (с десетична точка)
- e - float, double (scientific notation)
- x – шестнайсетична стойност на интегрални типове
- h – шестнайсетичен хеш код

Регулярни изрази (1)

- Символни класове
 - **.** Any character (may or may not match line terminators)
 - **\d** A digit: [0-9]
 - **\D** A non-digit: [^0-9]
 - **\s** A whitespace character: [\t\n\r\x0B\f]
 - **\S** A non-whitespace character: [^\s]
 - **\w** A word character: [a-zA-Z_0-9]
 - **\W** A non-word character: [^\w]

Регулярни изрази (2)

- Квалификатори:
 - **$X?$** X , once or not at all
 - **X^*** X , zero or more times
 - **X^+** X , one or more times
 - **$X\{n\}$** X , exactly n times
 - **$X\{n,\}$** X , at least n times
 - **$X\{n,m\}$** X , at least n but not more than m times
- **Greedy, Reluctant (?) & Possessive (+)**
квалификатори
- **Capturing Group - (X)**

Регулярни изрази (3)

- Клас **Pattern** – ОСНОВНИ МЕТОДИ:
 - `public static Pattern compile(String regex)`
 - `public Matcher matcher(CharSequence input)`
 - `public static boolean matches(String regex, CharSequence input)`
 - `public String[] split(CharSequence input, int limit)`
- Клас **Matcher** – ОСНОВНИ МЕТОДИ:
 - `public boolean matches()`
 - `public boolean lookingAt()`
 - `public boolean find(int start)`
 - `public int groupCount()` и `public String group(int group)`

Garbage Collection – Main Concepts

- Garbage collection and finalization – method **finalize()**
- Client and Server VMs (\neq JIT Compilers & Defaults), x86, x64
- Generational Garbage Collection – **Young, Old & ~~Permanent~~** (in Java 8 \rightarrow **Metaspace**) – Weak generational hypothesis:
 - Most of the objects become unreachable soon;
 - Small number of references exist from old to young objects.

- Tuning for **Higher Throughput**:

```
java -d64 -server -XX:+AggressiveOpts -XX:+UseLargePages -Xmn10g -Xms26g -Xmx26g
```

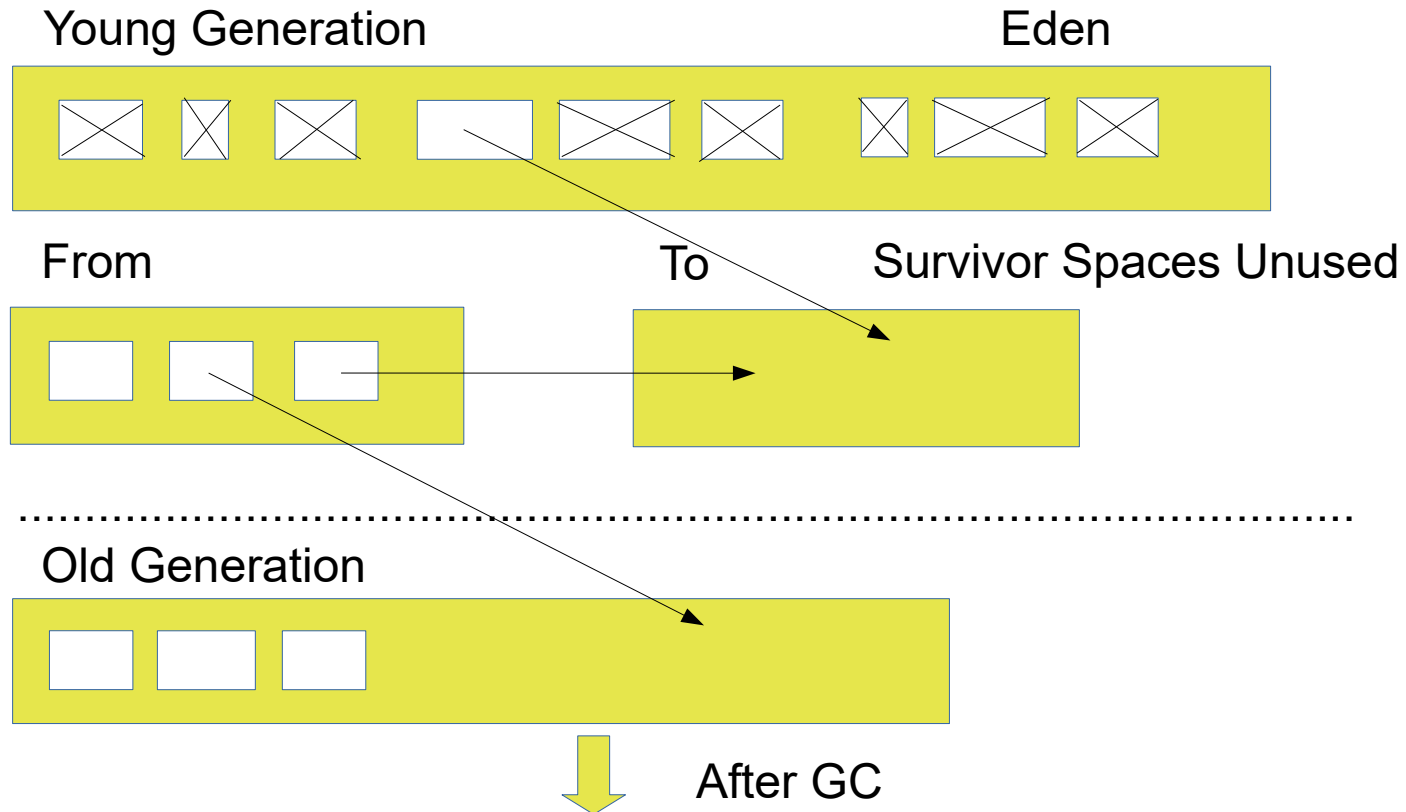

- Tuning for **Lower Latency**

```
java -d64 -XX:+UseG1GC -Xms26g Xmx26g -XX:MaxGCPauseMillis=500 -XX:+PrintGCTimeStamp
```

Garbage Collection – Main Concepts

Before GC

After GC

Garbage Collection – Basic Settings

- Xms** – Heap area size when starting JVM
- Xmx** – Maximum heap area size
- Xmn, -XX:NewSize** – размер на young generation (nursery)
- XX:MinHeapFreeRatio=<N>** –
XX:MaxHeapFreeRatio=<N>
- XX:NewRatio** – Ratio of New area and Old area
- XX:NewSize** **-XX:MaxNewSize** – New area size \leq Max
- XX:SurvivorRatio** – Ratio of Eden area and Survivor area
- XX:+PrintTenuringDistribution** – treshold and ages of New generation
- XX:+PrintGCDetails**
- XX:+PrintGCTimeStamps**

GC Strategies and Settings

Serial GC **-XX:+UseSerialGC**

Parallel GC **-XX:+UseParallelGC**

-XX:ParallelGCThreads=<N>

Parallel Compacting GC **-XX:+UseParallelOldGC**

Conc. Mark Sweep CMS GC **-XX:+UseConcMarkSweepGC**

-XX:+UseParNewGC

-XX:+CMSParallelRemarkEnabled

-XX:CMSInitiatingOccupancyFraction=<N>

-XX:+UseCMSInitiatingOccupancyOnly

G1 **-XX:+UseG1GC**

Garbage First G1 Partially Concurrent Collector

CMS GC (-XX:+UseConcMarkSweepGC)

Serial Mark-Sweep-Compact Collector

Stop-the-world pause

Stop-the-world pause

Concurrent Mark-Sweep Collector

Profiling Recommendations: GC

- **Garbage Collection** – be sure to minimize the GC interference by calling **System.gc()** several times before benchmark start. Call **System.runFinalization()** also. GC activity can be monitored using **-verbose:gc** JVM command. Another way to minimize GC interference is to use serial garbage collector using **-XX:+UseSerialGC** and same value for **-Xmx** and **-Xms**, as well as explicitly setting **-Xnm** flags.
- Use more precise **System.nanoTime()**, but be aware that the time can be reported with varying degree of accuracy in different JVM implementations.

Java Command Line Monitoring/Tuning Tools - I

jps – reports the local VM identifier (**lvmid** - typically the process identifier - **PID** for the JVM process), for each instrumented JVM found on the target system.

jcmd – reports class, thread and VM information for a java process: **jcmd <PID> <command> <optional arguments>**

jinfo – provides information about current system properties of the JVM and for some properties allows to be set dynamically:

jinfo -sysprops <PID>

jinfo -flags <PID>

jinfo -flag PrintGCDetails <PID>

jinfo -flag -PrintGCDetails <PID> - sets **-XX:-PrintGCDetails**

Java Command Line Monitoring/Tuning Tools -II

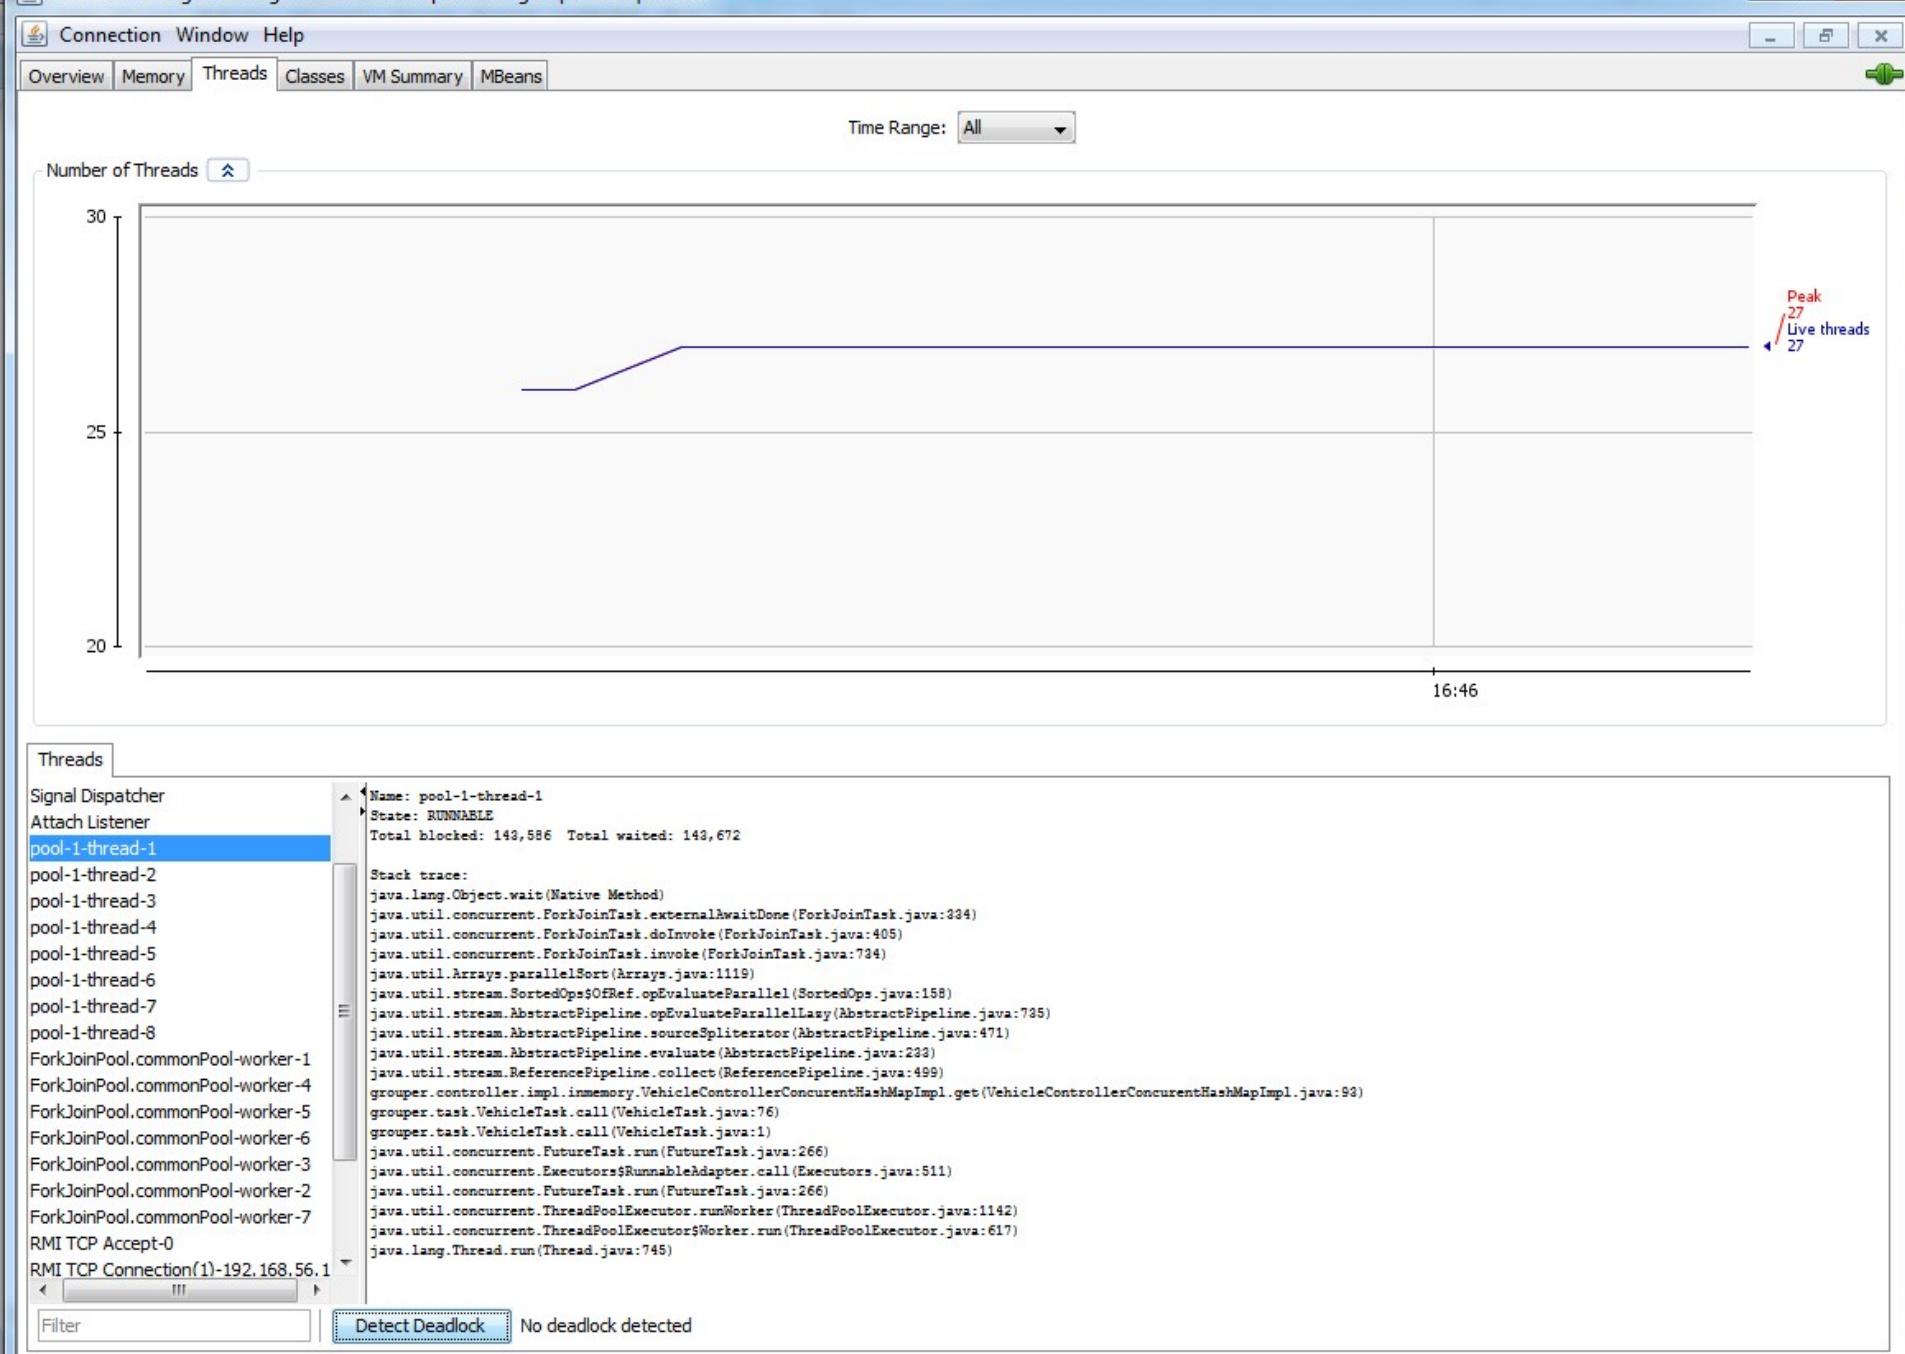

- **jstat & jstatd** – provide information about GC and class loading activities, useful for automated scripting (**jstatd** = RMI daemon):

jstat [generalOption | outputOptions vmid [interval[s|ms] [count]]] **Ex: jstat -gc -t -h20 4572 2s**

- Statistics options (part of **outputOptions**):
 - class** - statistics on the behavior of the class loader;
 - compiler** - behavior of the HotSpot Just-in-Time compiler;
 - gc** - statistics of the behavior of the garbage collected heap;
 - gccapacity** - capacities of the generations and their spaces;
 - gccause**, **-gcutil** - summary of garbage collection statistics/causes;
 - gcnew**, **-gcnewcapacity**, **-gcold**, **-gcoldcapacity**, **-gcpermcapacity**
 - Young/Old/Permanent generation stats
 - printcompilation** - HotSpot compilation method statistics

Java GUI tools – JConsole

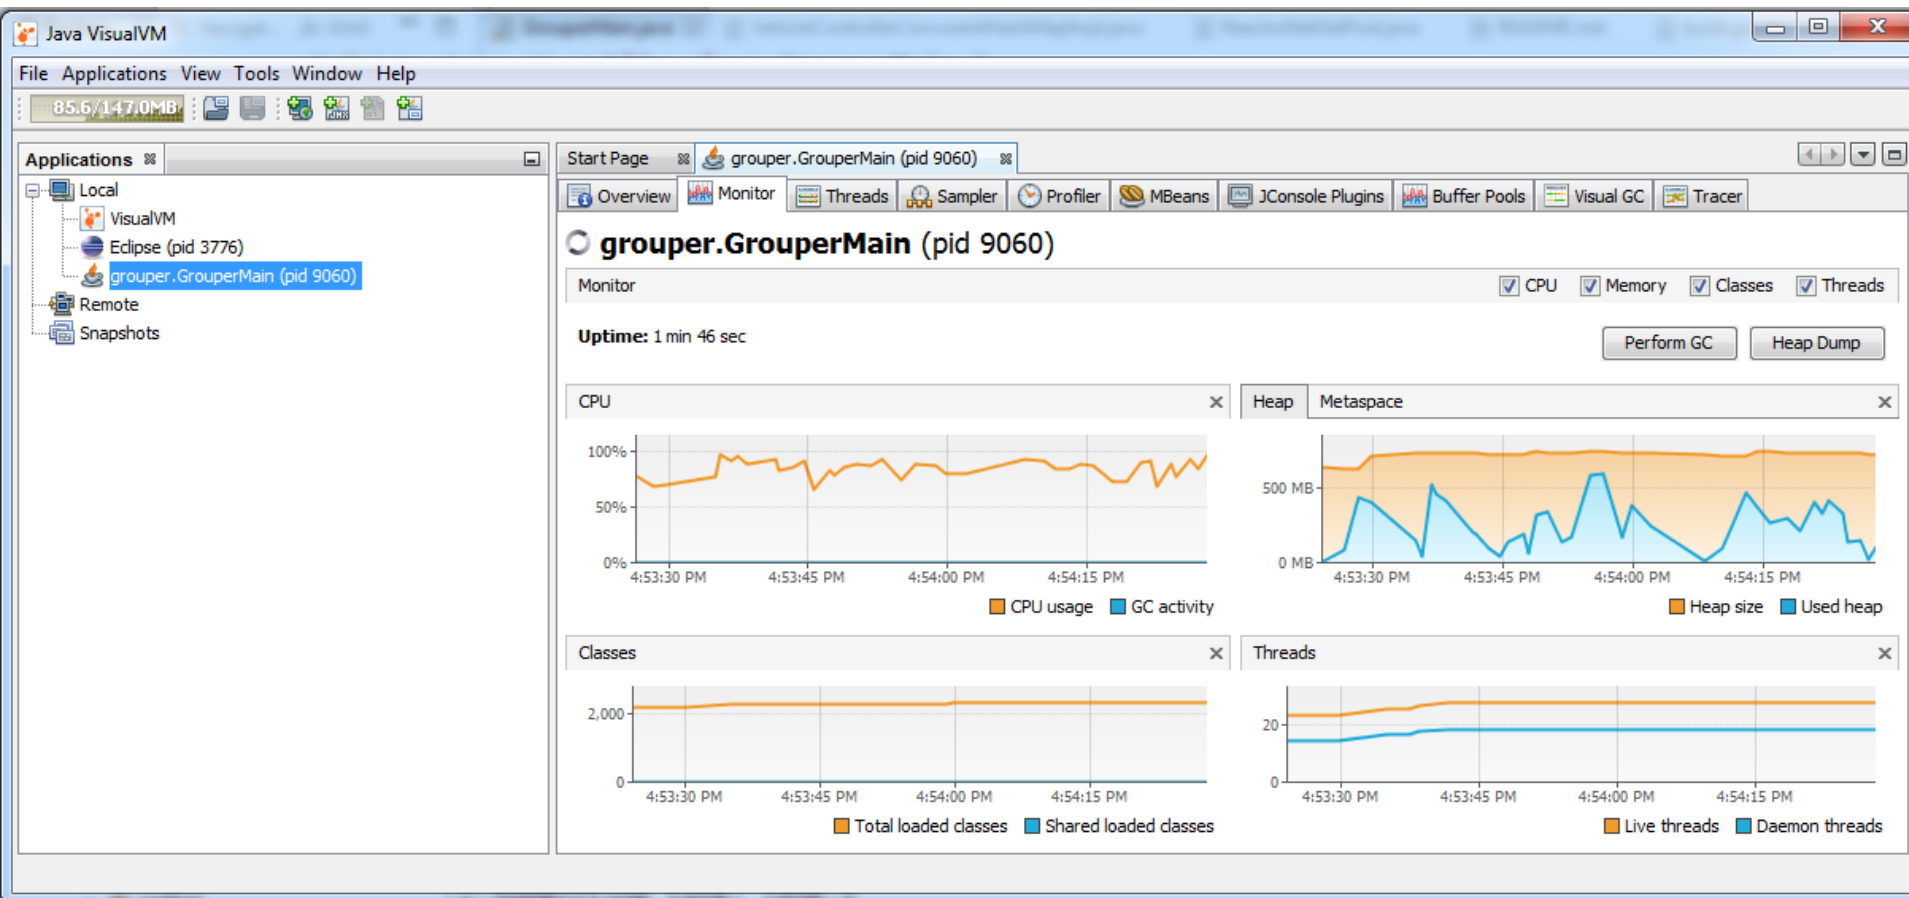

Details

Time: 2015-07-16 16:49:30
Used: 295,252 kbytes
Committed: 474,624 kbytes
Max: 1,840,640 kbytes
GC time: 0.000 seconds on PS MarkSweep (0 collections)
1.143 seconds on PS Scavenge (455 collections)

Category	Usage (%)
Heap	~85%
Non-Heap	~5%
